

Your home in space

What if: your next
home wasn't on
earth

Would you be
able to survive?

How?

How?

Would you be
able to survive?

First of all you would need a house

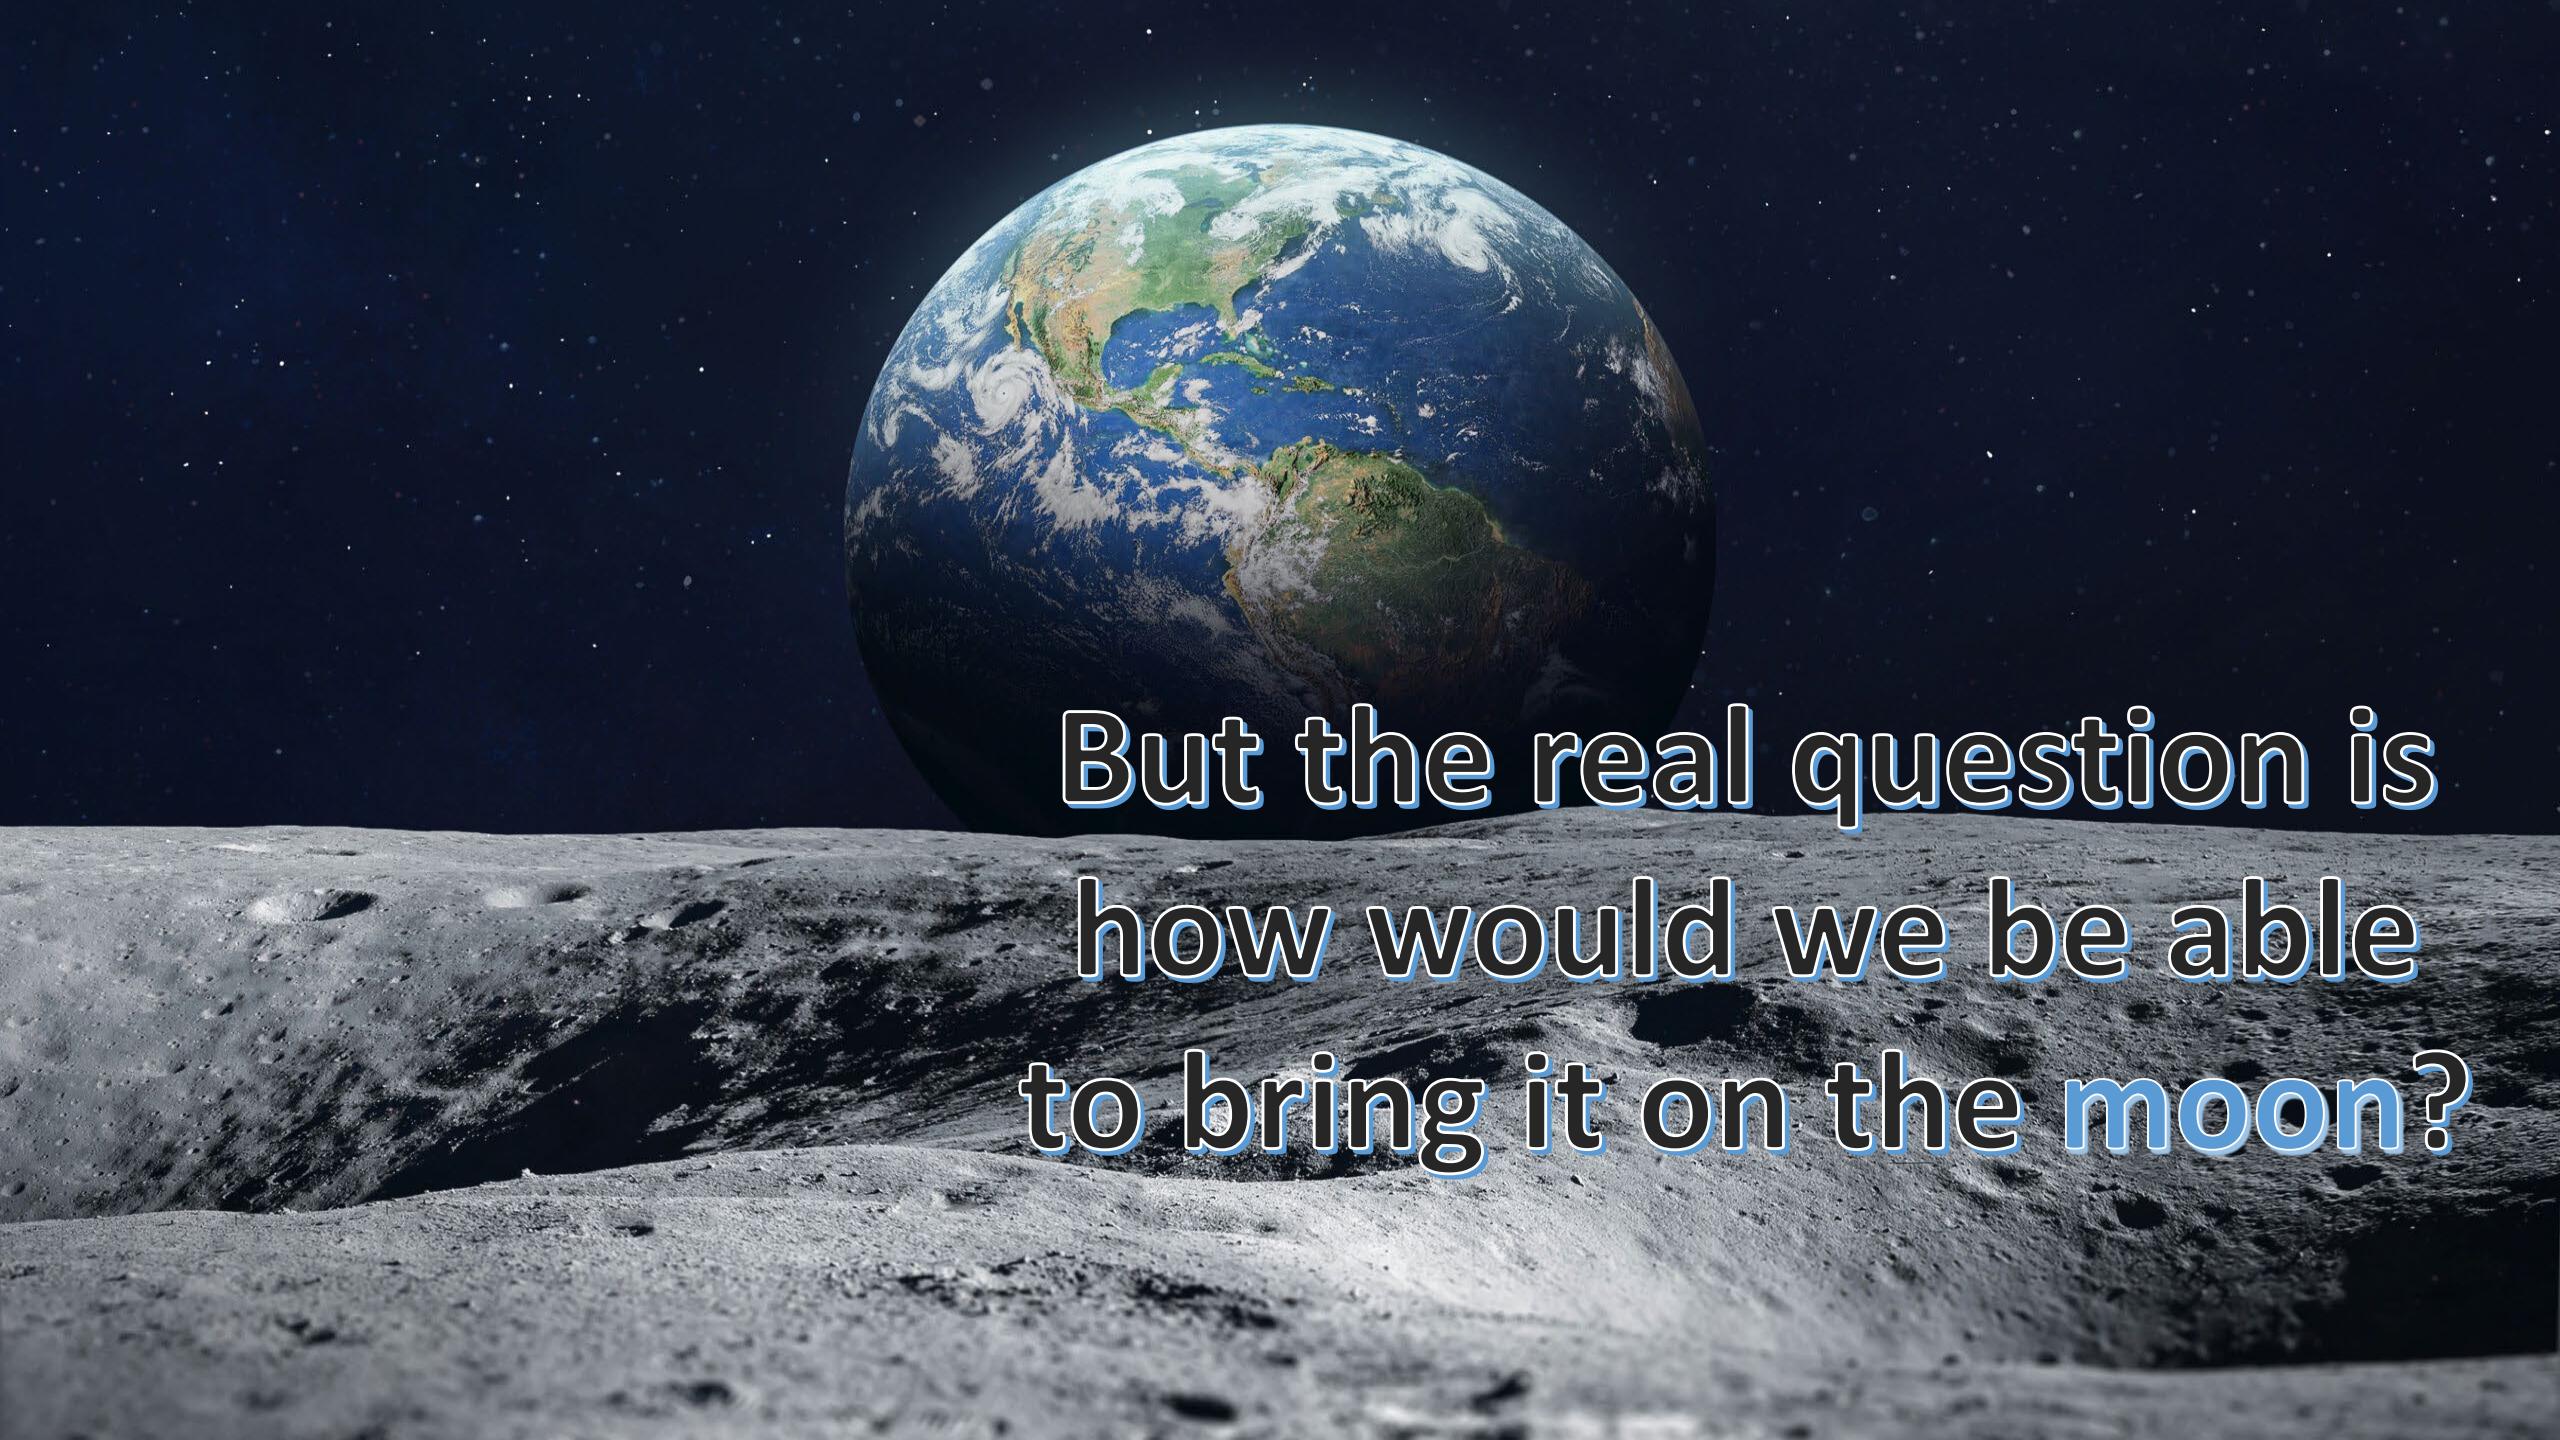

And the house would need to have the
necessaries to live

I don't think that house would fit
the moon

That's better

A photograph taken from the surface of the Moon, showing the dark, cratered terrain in the foreground and the full, vibrant blue and green Earth rising in the background against a black star-filled sky.

But the real question is
how would we be able
to bring it on the moon?

What if the house would be in
the rocket?

That would mean it should be like a
chamber that would be into the rocket
that would be left behind on the moon
for others

A photograph taken from the surface of the Moon, showing the dark, cratered terrain in the foreground. In the background, the Earth is visible as a large, blue and green sphere against a black space with numerous stars.

**It should be used by the
astronauts even when they
didn't arrive so we wouldn't
use more space**

We will start with the most important level
The ground

This level would have all the control of the racket and to talk to the humans back on earth

Thérèsthe astronaut's kitchen

Here the astronaut will train
for walking in low gravity

Let's add them all together
